

Exercises, Algebraic Geometry I – Week 1

Exercise 1. Direct sum of sheaves (3 points)

Let \mathcal{F}, \mathcal{G} be two sheaves of abelian groups on a topological space X . Show that $\mathcal{F} \oplus \mathcal{G}: U \mapsto \mathcal{F}(U) \oplus \mathcal{G}(U)$ defines a sheaf.

Exercise 2. Sheaf Hom (4 points)

For a (pre-)sheaf \mathcal{F} on a topological space X and an open subset $U \subset X$ one defines the restriction $\mathcal{F}|_U$ to be the (pre-)sheaf on the topological space U given by $\mathcal{F}|_U(V) := \mathcal{F}(V)$ for any open subset $V \subset U$. Then for two sheaves \mathcal{F}, \mathcal{G} of abelian groups, $\text{Hom}(\mathcal{F}|_U, \mathcal{G}|_U)$ denotes the abelian group of all sheaf homomorphisms $\mathcal{F}|_U \rightarrow \mathcal{G}|_U$. Show that this naturally defines a pre-sheaf $\text{Hom}(\mathcal{F}, \mathcal{G}): U \mapsto \text{Hom}(\mathcal{F}|_U, \mathcal{G}|_U)$ which is in fact a sheaf.

Exercise 3. Gluing of sheaves (5 points)

Let X be a topological space and let $X = \bigcup U_i$ be an open covering. We use the shorthand $U_{ij} := U_i \cap U_j$ and $U_{ijk} := U_i \cap U_j \cap U_k$.

Consider sheaves of abelian groups \mathcal{F}_i on U_i and isomorphisms (*gluings*) $\varphi_{ij}: \mathcal{F}_i|_{U_{ij}} \xrightarrow{\sim} \mathcal{F}_j|_{U_{ij}}$. Show that if the *cocycle condition* $\varphi_{ik} = \varphi_{jk} \circ \varphi_{ij}$ on U_{ijk} is satisfied, then there exists a sheaf of abelian groups \mathcal{F} on X together with isomorphisms $\varphi_i: \mathcal{F}|_{U_i} \cong \mathcal{F}_i$ such that $\varphi_{ij} \circ \varphi_i = \varphi_j$ on U_{ij} . The sheaf (\mathcal{F}, φ_i) is unique up to unique isomorphism.

Exercise 4. Exponential map (4 points)

Consider $X = \mathbb{C} \setminus \{0\}$ with its usual topology and let \mathcal{O}_X be the sheaf of holomorphic functions, i.e. $\mathcal{O}_X(U) = \{f: U \rightarrow \mathbb{C} \mid f \text{ holomorphic}\}$. Similarly, let \mathcal{O}_X^* be the sheaf of holomorphic functions without zeroes. (Throughout, you may work with differentiable functions instead of holomorphic ones if you prefer.)

Show that the exponential map defines a morphism of sheaves (of abelian groups)

$$\exp: \mathcal{O}_X \rightarrow \mathcal{O}_X^*, \mathcal{O}_X(U) \ni f \mapsto \exp(f) \in \mathcal{O}_X^*(U).$$

Find a basis of the topology on X such that $\exp_U: \mathcal{O}_X(U) \rightarrow \mathcal{O}_X^*(U)$ is surjective for all U in this basis. Note that $\mathcal{O}_X(X) \rightarrow \mathcal{O}_X^*(X)$ is not surjective. Describe the kernel of \exp_U .

The following exercise uses stalks, which will be introduced in the second lecture.

Exercise 5. ‘Espace étalé’ of a presheaf (4 points)

Let \mathcal{F} be a presheaf of sets on a topological space X . Define the set

$$|\mathcal{F}| := \bigsqcup_{x \in X} \mathcal{F}_x,$$

which comes with a natural projection $\pi: |\mathcal{F}| \rightarrow X$, $(s \in \mathcal{F}_x) \mapsto x$. Then any $s \in \mathcal{F}(U)$ defines a section of π over U by $x \mapsto s_x$. One endows $|\mathcal{F}|$ with the strongest topology such that all $s \in \mathcal{F}(U)$ define continuous sections $x \mapsto s_x$. Show that the sheafification \mathcal{F}^+ can be described as the sheaf of continuous sections of $|\mathcal{F}| \rightarrow X$.

The next exercise is not necessary for the understanding of the lectures at this point.

Exercise 6. *Grothendieck topologies* (4 extra points)

The notion of a (pre-)sheaf on a topological space can be formalized as follows: A *Grothendieck topology* $(\mathcal{C}, \text{Cov}_{\mathcal{C}})$ consists of a category \mathcal{C} with a set $\text{Cov}_{\mathcal{C}}$ of collections $\{\pi_i : U_i \rightarrow U\}_i$ of morphisms in \mathcal{C} (called *coverings* of U) subject to the following conditions:

- (1) Any isomorphism $\varphi : V \xrightarrow{\sim} U$ defines a covering $\{\varphi : V \rightarrow U\} \in \text{Cov}_{\mathcal{C}}$.
- (2) Suppose we are given $\{\pi_i : U_i \rightarrow U\}_i \in \text{Cov}_{\mathcal{C}}$ and for each i a covering $\{\pi_{ij} : U_{ij} \rightarrow U_i\}_j \in \text{Cov}_{\mathcal{C}}$. Then $\{\pi_i \circ \pi_{ij} : U_{ij} \rightarrow U\}_{ij} \in \text{Cov}_{\mathcal{C}}$ is a covering.
- (3) If $\{\pi_i : U_i \rightarrow U\}_i$ is a covering and $V \rightarrow U$ is a morphism in \mathcal{C} , then $\{\tilde{\pi}_i : U_i \times_U V \rightarrow V\}_i$ is a covering.

(In particular, one assumes that the fibre products in (3) exist. Recall the abstract notion of a fibre product.)

- (i) Show that for a topological space X the category of open sets Ouv_X comes with a natural Grothendieck topology given by the usual open coverings $U = \bigcup U_i$. Show that the notions presheaf, sheaf, stalk, morphism of (pre)sheaves, etc., can be phrased entirely in terms of this Grothendieck topology.
- (ii) For a finite group G consider the category $G\text{-Sets}$ of sets S with a left G -action $G \times S \rightarrow S$. Morphisms in this category are G -equivariant maps, i.e. maps that commute with the G -action. Show that the collections of $\{S_i \rightarrow S\}_i$ with $\bigcup S_i \rightarrow S$ surjective define a Grothendieck topology on $G\text{-Sets}$.
- (iii) The group G itself comes with natural left and right G -actions (by multiplication). The corresponding object is denoted $\langle G \rangle \in G\text{-Sets}$. Show that any sheaf \mathcal{F} of sets on $G\text{-Sets}$ yields a set $\mathcal{F}(\langle G \rangle)$ that is endowed with a natural left G -action. (In fact, \mathcal{F} is determined by this G -set, as $\mathcal{F}(S) = \text{Hom}_{G\text{-Sets}}(S, \mathcal{F}(\langle G \rangle))$. This association defines an equivalence of categories (Sheaves on $G\text{-Sets}$) $\xrightarrow{\sim} G\text{-Sets}$.)
- (iv) The final object in $G\text{-Sets}$ consists of a set $\{*\}$ of one element. Show that for a sheaf \mathcal{F} of sets the space of sections $\mathcal{F}(\{*\})$ is the fixed point set $\mathcal{F}(\langle G \rangle)^G$.
